ELISA

Detection Limit Antibody detection limit dilution 1:32000.

Western Blot Preliminary experiments gave bands at approx. 38kDa and 35kDa in Mouse Small Intestine lysates after 1µg/ml antibody staining. Please note that currently we cannot find an explanation in the literature for the bands we observe given the calculated size of 44.5kDa according to NP_064334.1. Both detected bands were successfully blocked by incubation with the immunizing peptide (and BLAST results with the immunizing peptide sequence did not identify any other proteins to explain the additional bands). We would appreciate any feedback from people in the field - have any results been reported with other antibodies/lysates? Have any further splice variants/modified forms been reported?
