Preliminary experiments gave an approx 80kDa band in lysates of cell lines Jurkat and MOLT4 after 0.2µg/ml antibody staining. Please note that currently we cannot find an explanation in the literature for the band we observe given the calculated size of 60.6kDa according to NP_060072.1. The 80kDa band was successfully blocked by incubation with the immunizing peptide. We would appreciate any feedback from people in the field - have any

results been reported with other antibodies/lysates? Have any further splice variants/modified forms been

reported?

Application

Pep-ELISA
