Limit

Preliminary experiments gave an approx 55kDa band in Human Lymph Node lysates after 0.3µg/ml antibody

staining. Please note that currently we cannot find an explanation in the literature for the band we observe given the calculated size of 40.0kDa according to NP\_002021.3. However, we do note that the protein is a glycoprotein. The 55kDa band was successfully blocked by incubation with the immunizing peptide. We would appreciate any

feedback from people in the field - have any results been reported with other antibodies/lysates?
