Detection

Western

Antibody detection limit dilution 1:32000.

Limit

Preliminary experiments gave an approx 60kDa band in human placenta and kidney lysates at 1ug/ml. This band was successfully blocked by incubation with the immunising peptide. Please note that currently we cannot find an explanation in the literature for the band we observe given the predicted size of approx. 96kDda according to NP_066564. We would appreciate any feedback from people in the field - have any results been reported with

other antibodies/lysates? Have any further splice variants/modified forms been reported?
