IHC Results

In paraffin embedded Human Liver shows a granular pattern in the cytoplasm of hepatocytes. Recommended

concentration, 5-10µg/ml.

ELISA

Detection Limit Antibody detection limit dilution 1:16000.

Western

Blot

Preliminary experiments gave an approx. 21kDa band in Human Kidney lysates after $0.5~\mu g/ml$ antibody staining. Please note that currently we cannot find an explanation in the literature for the band we observe given the calculated size of 17.4kDa according to $NP_060348.1$ (provisional). The 21kDa band was successfully blocked by incubation with the immunizing peptide. We would appreciate any feedback from people in the

field - have any results been reported with other antibodies/lysates? Have any further splice variants/modified

forms been reported?
