Detection

Limit

Antibody detection limit dilution 1:64000.

Approx. 110 kDa band observed in Human Ovary lysates (calculated MW of 121 kDa according to

Western

Blot

NP_443134.2). Recommended concentration: 0.3-1μg/ml. An additional strong band of unknown identity was also consistently observed at 48 kDa. This band was successfully blocked by incubation with the immunising peptide. We would appreciate any feedback from people in the field - have any such results been reported with

other antibodies/lysates? Have any further splice variants/modified forms been reported?
