ELISA

Detection

Antibody detection limit dilution 1:2000.

Limit

Preliminary experiments gave an approx 50kDa band in Human Breast and in Human EBV immortilized lymphoblastoid lysates after 0.3µg/ml antibody staining. Please note that currently we cannot find an explanation

Western **Blot**

in the literature for the band we observe given the calculated size of 21.7kDa according to NP_057203.1. The 50kDa band was successfully blocked by incubation with the immunizing peptide. We would appreciate any feedback from people in the field - have any results been reported with other antibodies/lysates? Have any further

splice variants/modified forms been reported?
