**Western Blot** Preliminary experiments gave an approx 25-26kDa band in lysates of Human Duodenum, Colon and Placenta after 1µg/ml antibody staining. Please note that currently we cannot find an explanation in the literature for the band we observe given the calculated size of 110kDa according to NP\_065908.1. The 25-26kDa band was successfully blocked by incubation with the immunizing peptide. We would appreciate any feedback from people in the field - have any results been reported with other antibodies/lysates? Have any further splice variants/modified forms been reported?
